Attention: Mr. Luis Diaz, P.E.

Subject: Level 2 Contamination Impact Assessment Report
SR 400 (I-4) Project Development and Environment (PD&E) Study
Segment 2
Ponds 205B, 205C, 205D, 206, 206A, and 206B
Orange County, Florida
Financial Project No. 432100-1-22-01
GEC Project No. 3492E

Dear Mr. Diaz:

Geotechnical and Environmental Consultants, Inc. (GEC) is pleased to submit this Level 2 Contamination Impact Assessment Report (Level 2 Assessment) for the above-referenced project. The Level 2 Assessment presented herein was conducted based in part on the findings and opinions presented in the Contamination Screening Evaluation Report Update, dated January 2014, prepared by Stantec.

GEC performed Level 2 Assessment activities at three sites within the project corridor and reviewed the public files for a fourth site. This report documents conditions at the time the investigations were performed (December 2014 and February 2015) and at the locations and depths that soil and groundwater samples were obtained. The results presented herein may not reflect conditions that may exist at other times or at other locations on the sites.

We appreciate the opportunity to be of service to you on this project and trust this information is sufficient for your needs. Should you have any questions concerning this report, or if we may be of further assistance, please contact us.

Sincerely,

GEOTECHNICAL AND ENVIRONMENTAL CONSULTANTS, INC.

1.0 INTRODUCTION

Geotechnical and Environmental Consultants, Inc. (GEC) has been retained by HNTB, on behalf of the Florida Department of Transportation (FDOT), to provide a Level 2 Contamination Impact Assessment (Level 2 Assessment) for the SR 400 (I-4) Project Development and Environment (PD&E) Study, Segment 2.

The CSER identified proposed stormwater ponds 205B, 205C and 205D as being within an area of historic citrus groves and Ethylene DiBromide groundwater impacts.

Ponds 206, 206A and 206B are located in the vicinity of a historic gasoline station that had documented soil and groundwater impacts.

The Contamination Screening Evaluation Report (CSER), dated January 2014, was prepared by Stantec for this project. The CSER identified proposed stormwater ponds 205B, 205C and 205D as being within an area of historic citrus groves and Ethylene DiBromide groundwater impacts. The three proposed stormwater ponds were assigned a Medium risk rating. Ponds 206, 206A and 206B are located in the vicinity of a historical gasoline station that had documented soil and groundwater impacts. GEC and FDOT determined that proposed pond stormwater pond 205B, 205C, 205D, 206, 206A and 206B sites warranted further investigation at this time. Asbestos

sampling was also performed on debris piles within the vacant property containing Ponds 205B and 205C.

This Level 2 Assessment was conducted in general accordance with the Chapter 22-2.7 of the FDOT Project Development & Environment (PD&E) Manual and the Sampling and Analysis Plan, dated June 4, 2014. Discussions regarding potential project implications associated with the proposed stormwater ponds are presented herein.

1.1 Purpose

The purpose of the Level 2 Assessment was to verify the potential presence of chemical contaminants that could affect ROW acquisition, design and/or construction of the proposed roadway. If the presence of such contaminants is verified, further delineation of the horizontal and vertical extent of the soil and/or groundwater contaminant plumes may be needed to support ROW acquisition and associated liability protections. Such additional data may also be necessary to support stormwater management system design, foundation design, and design of remedial strategies that may be necessary during construction to properly mitigate the impacted media without causing adverse impacts to workers and the environment.

1.2 Objectives

The objectives of the Level 2 Assessment presented herein were to: (i) assess the potential for soil and groundwater impacts associated with anticipated contaminant source area(s) via soil and groundwater screening techniques; (ii) provide information necessary to evaluate project impacts associated with ROW acquisition and construction activities; and (iii) provide site-specific recommendations based on the Level 2 Assessment results and the current roadway design plans.

1.3 Organization of Report

The remainder of this Level 2 Assessment Report is organized as follows:

Section 2.0: *Project Description* - provides an overview of the SR 400 (I-4) Project Development and Environment (PD&E) Study, Segment 2.

Section 3.0: *Summary of Potential Contamination Risk Sites* - provides a summary of the potential contamination sites that were identified in the environmental contamination screening evaluation.

Section 4.0: *Contamination Impact Assessment Methodology* - summarizes the sampling activities performed for this Level 2 Assessment.

Section 5.0: *Investigation Results* - provides a general summary of the sampling results.

Section 6.0: *Data Quality* - summarizes the data quality objectives, and field and laboratory quality control and quality assurance procedures.

Section 7.0: *Conclusions and Recommendations* - summarizes the sampling results and provides site-specific recommendations for the project.

Section 8.0: *Report Limitations* - presents specific limitations associated with the preliminary assessment activities and results herein.

Section 9.0: *Use of Report* - describes the terms of use of this report.

Figures and tables that provide specific details of the Level 2 Assessment activities are presented in the Appendix. Copies of all field documentation are provided in **Appendix A** and a copy of the

analytical laboratory report is provided in **Appendix B**. An asbestos survey of debris piles in the area proposed for Ponds 205B and 205C is provided in **Appendix C**.

2.0 PROJECT DESCRIPTION

The Florida Department of Transportation (FDOT) will reconstruct and widen I-4 as part of the I-4 Beyond the Ultimate project. This involves the build-out of I-4 to its ultimate condition, including segments in Polk, Osceola, Orange, Seminole, and Volusia Counties. Segment 2 of the project is located in southwest Orange County, Florida. The project corridor is located in Sections 35 and 36, Township 23 South, Range 28 East, and Sections 1, 2, 11, and 12, Township 24 South, Range 28 East in Orange County, Florida.

The I-4 Ultimate design incorporates three (3) general use lanes and two (2) tolled express lanes in each direction, for a total of ten (10) dedicated lanes. Segment 2 extends from $\frac{1}{2}$ mile south of SR 528 to south of SR 435 (Kirkman Road) and includes the interchanges at SR 528, Sand Lake Road, and Universal Boulevard. Stormwater runoff will be directed to several new stormwater ponds along the corridor.

The Segment 2 project alignment is bordered mostly by commercial buildings with sparse sections of undeveloped land consisting of pine flatwoods and palmetto bushes. Many of the proposed ponds are located in developed areas or near I-4 roadway/ramps; therefore, natural drainage patterns have been affected by previous construction.

This Level 2 Assessment includes investigation and analyses at the proposed locations for Ponds 205B, 205C and 205D. Research for Ponds 206, 206A and 206B included a review of the Florida Department of Environmental Protection (FDEP) OCULUS files. Asbestos sampling was performed on debris piles within the vacant property containing Ponds 205B and 205C.

Pond 205C was designated Pond 205A within the January 2014 CSER and within the initial Level 2 Assessment activities.

Pond 205C was designated Pond 205A within the January 2014 CSER and within the initial Level 2 Assessment activities.

The project study area is shown on the St. Johns River Water Management District Land Use Map, a USGS Quadrangle Map, and the National Resource Conservation Services (NRCS) Soil Survey Map provided on **Figures 1 and 2**.

3.0 SUMMARY OF POTENTIAL CONTAMINATION RISK SITES

The Level 2 Assessments for the following potential contamination sites were recommended due to the lack of sufficient contamination assessment information, documented groundwater flow direction, and/or the distance/location of the sites relative to planned ROW acquisition/construction. The following descriptions are provided for each site addressed in this Level 2 Assessment. **Figures 1 through 4** show the approximate locations of Ponds 205B, 205C, 205D, 206, 206A and 206B.

3.1 Groundwater Contamination Plume #48263254 (Site No. 17)

The following description was taken from the January 2014 CSER:

The contaminant associated with this plume is the agricultural pesticide ethylene dibromide (EDB), which is usually associated with citrus growing. According to FDEM Map Direct, the contamination plume is under approximately 0.72 miles of the current right-of-way from the approximate vicinity of Dr. P. Phillips Hospital to Wal-Mart Supercenter #4332 and in the surrounding vicinity. FDOT Pond Sites 205A and 205B (Site 37) are the only potential pond sites within the identified contamination plume. There are fifteen additional contamination sites located within this plume that are given individual ratings. This plume is rated MEDIUM RISK due to the potential for contamination to be present. Further investigation, including soil and groundwater tests, should be conducted within the right-of-way, at Pond sites 205A and 205B (site 37), and wherever demolition and dewatering activities will occur within the EDB contamination plume.

3.2 Vacant Lots, Potential FDOT Pond Sites 205A and 205B (Site No. 37)

The following description was taken from the January 2014 CSER:

This site has been proposed for the future site of FDOT Ponds 205A and 205B. They are located at 9287 and 9200 Turkey Lake Road. Boo Boo Lake is located on the property and surrounded by overgrown vegetation that used to be the site of a campground. There are no records of contamination associated with this site, but several areas of concern were identified during a site visit. There are several piles and scattered clusters of discarded roofing tiles throughout the site: a demolished building left in a pile, discarded trash debris, and old tires. The site has also been identified as being within Groundwater Contamination Plume #48263254 (Site 17) for ethylene dibromide (EDB). This site is ranked a MEDIUM RISK due to the potential for discarded materials to contain asbestos or lead-based paint and the site being within a contamination plume with plans

to build ponds on the site. Tests for asbestos-containing materials and lead-based paint should be performed in addition to soil and groundwater testing for EDB before proceeding with construction.

3.3 FDOT Right-of-Way, former 7-Eleven Food Store #21315 (Site No. 72)

The following description was taken from the January 2014 CSER:

This former LUST site was located at 7957 Sand Lake Road, which is currently the I-4 interchange with Sand Lake Road at the ramps northwest of the current right-of-way. In May, 1989, 522 tons of leaded/unleaded gasoline contaminated soil was excavated and removed to a depth of six feet. The area is considered clean because it was over-excavated to remove any excess contamination, but there is no record regarding the source or the size of the original contamination discharge. This site is rated LOW RISK due to it being already owned by the FDOT and considered clean, but there could be a potential for contamination to exist deeper in the soil.

3.4 Pond 206

The following description was taken from the January 2014 CSER:

Pond Site 206 is located at the interchange of I-4 and Sand Lake Road in the northwestern quadrant, adjacent to the onramp to I-4 westbound from Sand Lake Road, and the off-ramp from I-4 westbound to Sand Lake Road. This is an existing dry pond that was permitted during the design of this interchange, and will be converted to a wet pond for the purposes of this project. The site is primarily open grass, though a rim-ditch is found along the perimeter to convey run-off, and the area in the southeastern portion contains wetland vegetation such as Carolina willow, primrose willow, and Brazilian pepper. No obvious signs of contamination were observed in the field for this site. Therefore, this pond site was given a LOW RISK rating.

4.0 CONTAMINATION IMPACT ASSESSMENT METHODOLOGY

The following sections provide detailed descriptions of the Level 2 Assessment activities based on known site conditions and our understanding of the SR 400 PD&E Study project needs. Field logs generated during performance of the Level 2 Assessment activities are provided in **Appendix A**.

4.1 Boring Locations

The soil boring locations were based on the limits of Ponds 205B, 205C and 205D. The soil borings were placed at locations most likely to encounter evidence of subsurface contamination resulting from past or current on-site activities. GEC technicians obtained geographic coordinate information at each soil boring and temporary groundwater monitoring well locations. **Table 1** presents the site-specific sampling and analysis rationale for each site. **Figure 3** shows the locations of the soil borings at each of the pond sites investigated.

4.2 Hand Auger Borings

GEC technicians performed standard barrel hand auger borings, by manually turning a 3.25-inch diameter, 6-inch long stainless steel sampler into the soil until the barrel was filled. The sampler was then retrieved and the soil was visually examined and classified. This procedure was repeated until the desired termination depth was achieved. Representative soil samples were collected for further visual examination, organic vapor screening and analytical laboratory testing, where applicable. The hand auger equipment was decontaminated in accordance with Florida Department of Environmental Protection (FDEP) Standard Operating Procedures (SOPs) prior to collecting soil samples for chemical analysis.

Following the completion of the subsurface activities, the soil cuttings were returned to their original location as backfill for the boreholes, in order to return the site as close to its original condition as possible.

4.3 Direct-Push Soil Sampling

Soil samples were also obtained by a truck-mounted Simco⁷ hydraulic direct-push rig. Continuous soil samples were obtained by hydraulically driving a 3-inch macro-core soil sampler to the desired depth in 5-foot intervals. Upon retrieval of the soil sample, a field technician visually examined and classified the soil sample. The direct-push sampling equipment was decontaminated in accordance with Florida Department of Environmental Protection (FDEP) Standard Operating Procedures (SOPs) between sampling locations.

Following the completion of the subsurface activities, the soil cuttings were returned to their original location as backfill for the boreholes, in order to return the site as close to its original condition as possible.

4.4 Organic Vapor Soil Screening

In order to assess the potential for petroleum product or volatile hazardous material contaminated soils that may have resulted from activities conducted on or adjacent to each site, GEC screened soil samples obtained at a total of 32 boring locations. **Figure 3** shows the approximate soil boring locations at each respective site.

Soil samples were collected at approximate 2-foot subsurface sampling intervals beginning one foot below the ground surface to a maximum of 20 feet below land surface (bls). Soil samples that were retrieved from the hand auger and direct push borings were visually inspected for indications of soil contamination, such as soil staining and/or odors, which might be indicative of hazardous material or petroleum product impacts. Samples from each of the borings were screened in the field using a calibrated Thermo Electron Corporation Model TVA-1000B Organic Vapor Analyzer (OVA) equipped with a flame ionization detector (FID) following guidelines for head space analysis set forth in the FDEP document entitled Guidelines for Assessment and Source Removal of Petroleum Contaminated Soil, dated May 1998.

Glass sample jars were half-filled with soil, covered with aluminum foil, sealed, and set aside to allow the volatiles to equilibrate throughout the head space. The organic vapor response for each soil sample was determined by inserting the probe of the OVA-FID into the head space of the sample container and recording the highest sustained reading. The two-jar method was used to obtain total organic vapor readings and carbon filter readings, to account for the presence of naturally occurring methane in site soils. The resultant total non-methane hydrocarbon level is calculated by subtracting the carbon filtered response from the total response. Organic vapor measurements are summarized on **Tables 2A** through **2C**. Soil boring logs are included in **Appendix A-1** and equipment calibration logs are included in **Appendix A-2**.

4.5 Soil Sampling and Analysis

Soil samples for analytical testing were collected from the locations that exhibited the highest OVA readings or locations that were most likely to encounter contaminated media to verify the potential presence of chemical impacts. The samples were transported to Environmental Conservation Laboratories (ENCO) and Advanced Environmental Laboratories (AEL) for analysis.

Composite soil samples for pesticides and herbicides were taken from depths of 0 to 2 feet bls at four locations in Ponds 205B and 205C, and at three locations in Pond 205D as follows:

Soil Sample Locations

Pond 205B		Pond 205C		205D	
Sample ID	Soil Boring ID	Sample ID	Soil Boring ID	Sample ID	Soil Boring ID
CS-17	SB-10	CS-13	SB-5	CS-28	SB-124
CS-18	SB-16	CS-14	SB-6	CS-29	SB-132
CS-19	SB-17	CS-15	SB-7	CS-30	SB-130
CS-20	SB-22	CS-16	SB-1	-	-

An additional sample (SB-9 @ 17') was taken at 17 feet bls from within SB-9, the highest OVA value encountered in Pond 205C.

Table 1 summarizes the site-specific sampling rationale and analytical methods used. Soil sample locations are shown for each site on **Figure 3**.

GEC compared the analytical results of chemical constituents to the Soil Cleanup Target Levels (SCTLs) provided in Chapter 62-777, FAC. **Tables 3A** through **3C** provide a summary of the detected constituent concentrations exhibited within the collected analytical samples. A detailed discussion of the soil analytical results is included in Section 7.0.

4.6 Groundwater Sampling and Analysis

To assess the potential for groundwater contamination impacts that may have resulted from chemical releases, GEC obtained analytical groundwater samples from each site by installing a temporary groundwater monitoring well. The sampling locations were based on the OVA soil screening results and field observations. The wells were installed by GEC utilizing hand auger methods. The well assembly consisted of an approximately 5-foot section of pre-packed 1-inch diameter, 0.01-inch factory slotted polyvinyl chloride (PVC) pipe coupled with a PVC monitoring well point (bottom) and topped with a section of solid PVC riser. The PVC well point, well screen, and riser were transported to the site wrapped in protective plastic. After removing the protective wrap, the assembled groundwater monitoring well was lowered into a 3.25-inch steel casing. Following installation of the well assembly, the steel casing was removed. Subsequent to sampling activities, the temporary well was properly abandoned or removed from the ground.

GEC collected the groundwater sample using low-flow sampling techniques and transported the samples to ENCO and AEL for analysis. The groundwater samples collected from TMW-5 at Pond 205C were submitted for analysis by EPA methods 8260 for VOAs, 8270 for PAHs, FL-Pro for TRPH, 6010 for arsenic, 8081 for pesticides, and 8082 for PCBs. The groundwater samples collected from TMW-6 at Pond 205B were submitted for analysis by EPA methods 601 for arsenic, 8081 for pesticides, and 8151 for herbicides. The groundwater samples collected from TMW-11 at Pond 205D were submitted for analysis by EPA methods 601 for arsenic, 8141 for pesticides and 8151 for herbicides. A detailed discussion of the groundwater analytical results is included in Section 7.0. **Table 1** summarizes the site-specific sampling rationale and analytical methods used. The groundwater sample locations are shown for each site on **Figure 3**. The groundwater sampling log and well construction detail are provided in **Appendix A-3**.

5.0 INVESTIGATION RESULTS

The following sections describe the results of the Level 2 Assessment activities. **Figure 3** shows the sample locations at each site. **Table 1** summarizes the site-specific sampling rationale and analytical methods used. **Tables 2A** through **2C** present the results of the OVA screening. **Tables 3A** through **3C** and **4** provide summaries of soil and groundwater chemical detections as compared to applicable FDEP default clean-up target levels. Only chemical detections are listed in the laboratory results summary tables.

5.1 Soil OVA Soil Screening

The results of the OVA soil screening conducted at a total of 32 boring locations are included in **Tables 2A** through **2C**. Elevated net soil screening values (>10) were detected within the following borings: SB-5, SB-6, SB-8, and SB-9. Organic odors were observed within the following borings: SB-6, SB-8, SB-9, SB-10, SB-124, SB-127 and SB-129.

Soil samples were collected for analytical laboratory testing at the locations and depths which exhibited the highest positive OVA soil screening results, or were most likely to encounter contamination due to property use and field observations. Detailed discussions of the soil OVA screening results for each site are included in Section 7.0. **Tables 2A** through **2C** also indicate the soil types, groundwater depths, and dates that the borings were performed.

5.2 Soil Analysis

Soil samples were collected for analytical laboratory testing based on the results of the OVA soil screening, the roadway alignment, and the proximity to potential chemically-impacted soils. GEC compared the analytical results to SCTLs provided in Chapter 62-777, FAC. Detectable concentrations of chemicals were identified in the soil samples, but the concentrations did not exceed the FDEP SCTLs for direct exposure in residential or industrial settings. **Tables 3A through 3C** provide a summary of the detected constituent concentrations exhibited within the collected analytical samples. A detailed discussion of the soil analytical results is included in Section 7.0.

5.3 Groundwater Analysis

To assess the potential for groundwater contamination impacts that may have resulted from chemical releases, one groundwater sample was collected for analytical laboratory testing at each proposed pond site (TMW-6 in Pond 205B, TMW-5 in Pond 205C and TMW-11 in Pond 205D). The sample locations were chosen based on the OVA soil screening results. GEC compared the analytical results of chemical constituents to the Groundwater Cleanup Target Levels (GCTLs) provided in Chapter 62-777, FAC. Detectable concentrations of chemicals were identified in the groundwater sample TMW-5, but contaminant concentrations did not exceed FDEP GCTLs for direct exposure in residential or commercial settings. **Table 4** provides a summary of the detected constituent concentrations exhibited within the collected analytical samples. A detailed discussion of the groundwater analytical results is included in Section 7.0.

6.0 DATA QUALITY

6.1 Data Quality Control and Validation

In order to achieve the data quality objectives (DQOs), various field and laboratory quality assurance and quality control (QA/QC) procedures were implemented to verify the integrity of the chemical data. The following provides a summary of the QA/QC framework used to obtain the target DQOs.

6.2 Field QA/QC

All soil and groundwater sampling activities performed by GEC personnel during this environmental investigation were conducted in accordance with FDEP Standard Operating Procedures for Field Activities (FDEP SOP-001/01), FS-2200 (Groundwater Sampling), and FS-3000

(Soil Sampling) dated March 1, 2014. Field instrument calibration forms and groundwater sampling logs are provided in **Appendix A-2** and **A-3**, respectively.

6.3 Laboratory QA/QC

All soil and groundwater samples were submitted in laboratory-supplied containers for analysis to Environmental Conservation Laboratories, Inc. (NELAP #E83182). Laboratory analytical methods and reporting were conducted in accordance with Chapter 62-160, FAC to ensure high data quality. The laboratory reports indicated that the laboratory analyzed the samples using the correct analytical methods. In general, control limits were within acceptable ranges for all laboratory quality assurance samples, method blanks, surrogate standards, laboratory control spikes (LCS), and matrix spikes / matrix spike duplicates (MS/MSD). As shown on **Tables 3A** through **3C** and **4**, chemical constituents that were identified at concentrations at or near the laboratory method detection limits (MDLs), but below the laboratory practical quantitation limits were assigned an "I" qualifier.

Analytical laboratory reports are included in **Appendix B**. Due to the preliminary screening nature of this investigation, equipment blanks and field duplicate samples were not collected during the field activities.

7.0 CONCLUSIONS AND RECOMMENDATIONS

The following subsections describe the site-specific conclusions and recommendations based on supplemental public record review, soil screening activities, analytical laboratory results, and the proposed roadway alignment associated with the I-4 PD&E Study, Segment 2, Ponds 205B, 205C, 205D, 206, 206A and 206B project.

7.1 Pond 205B

GEC performed 13 soil screening borings at this site as shown on **Figure 3**. Soil borings SB-10 through SB-22 were positioned at regular intervals within the limits of the proposed Pond 205B. The groundwater table was encountered between approximately 8.5 to 12.5 feet below land surface at this site. The soil borings did not exhibit an elevated organic vapor response. Boring SB-10 had an organic odor within the one to three foot depth; the remaining borings did not have any indicative odors. Composite soil samples were collected at the locations of borings SB-10, SB-16, SB-17 and SB-22 at depths of 0 to 2 feet bbls and submitted for analyses for arsenic, pesticides, and herbicides. The groundwater sample was obtained from TMW-6 (SB-11) and submitted for

analyses for arsenic, pesticides, and herbicides. The laboratory analytical results indicated detections in the samples at levels below commercial and residential cleanup target levels listed in Chapter 62-777, FAC and Maximum Contaminant Levels listed in Chapter 62-550, FAC.

Based on the results of the Level 2 Assessment, it appears that the soils and groundwater at the proposed Pond 205B location have not been impacted at this time and would not require special handling, characterization, and disposal provisions. GEC does not recommend any further contamination assessment at this location.

7.2 Pond 205C

GEC performed 9 soil screening borings at this site, as shown on **Figure 3**. Soil borings SB-1 through SB-9 were located at regular intervals throughout the pond site. A large soil mound was found on site in the area encompassed by soil borings SB- 3, SB-6, and SB-9. The soil mound was greater than 10 feet tall. The highest OVA readings (>1,000) and organic odors were encountered within this soil mound.

The groundwater level ranged from approximately 7 feet to greater than 20 feet below the ground surface, depending on the soil boring location relative to the soil mound. Soil borings SB-5, SB-6, SB-8 and SB-9 exhibited elevated net OVA responses (greater than 10 ppm). The elevated OVA readings were within both the vadose and saturated zones. The remainder of the soil samples did not exhibit an elevated organic vapor response (greater than 10 ppm) and did not have any indicative odors.

Composite soil samples were collected at the locations of borings SB-1 and SB-5 through SB-7 at depths of 0 to 2 feet bls and submitted for analyses for arsenic, pesticides, and herbicides. An additional soil sample was obtained from the location of SB-9 at a depth of 17 feet bls, where the net OVA value was recorded at 4,970. Temporary well TMW-5 was installed west of and adjacent to the soil mound, between SB-6 and SB-9. The groundwater from TMW-5 and soil from SB-9 were analyzed for the Table D Waste Oil/Unknown Group. The laboratory analytical results indicated detections in the soil and groundwater samples at levels below commercial and residential cleanup target levels listed in Chapter 62-777, FAC and Maximum Contaminant Levels listed in Chapter 62-550, FAC.

Based on the results of the Level 2 Assessment, it appears that the soils and groundwater at the proposed Pond 205C location have not been impacted at this time and would not require special

handling, characterization, and disposal provisions. GEC does not recommend any further contamination assessment at this location.

7.3 Asbestos Survey

Asbestos sampling was performed on debris piles within the vacant property containing Ponds 205B and 205C. Samples were taken from several debris piles and vinyl sheet flooring on a concrete slab. Non-friable asbestos containing materials were found within chimney flashing (2 square feet), heating ventilation and air conditioning (HVAC) duct mastic (10 square feet) and vinyl sheet flooring (1,200 square feet) onsite. Please see the attached asbestos report in **Appendix C**.

Based on the results of the Asbestos Assessment, it appears that the debris at this location will require special handling, characterization, and disposal provisions.

Based on the results of the Asbestos Assessment, it appears that the debris at this location will require special handling, characterization, and disposal provisions.

7.4 Pond 205D

GEC performed 10 soil screening borings at this site as shown on **Figure 3**. Soil borings SB-123 through SB-132 were positioned at regular intervals within the limits of the proposed Pond 205D. The groundwater table was encountered between approximately 5.0 to 8.5 feet below land surface at this site. The soil borings did not exhibit an elevated net organic vapor response. Borings SB-124, 127 and 129 had organic odors; the remaining borings did not have any indicative odors. Composite soil samples were collected at the locations of borings SB-124, SB-130 and SB-132 at depths of 0 to 2 feet bbls and submitted for analyses for arsenic, pesticides, and herbicides. The groundwater sample was obtained from TMW-11 (SB-129) and submitted for analyses for arsenic, pesticides, and herbicides. The laboratory analytical results indicated detections in the samples at levels below commercial and residential cleanup target levels listed in Chapter 62-777, FAC and Maximum Contaminant Levels listed in Chapter 62-550, FAC.

Based on the results of the Level 2 Assessment, it appears that the soils and groundwater at the proposed Pond 205D location have not been impacted at this time and would not require special handling, characterization, and disposal provisions. GEC does not recommend any further contamination assessment at this location.

7.5 Ponds 206, 206A and 206B

Mr. Randy Stafford of FDOT, District 5 requested that GEC review the available public file documents for the historical 7-Eleven facility (FAC 8512588 – addressed at 7957 Turkey Creek Road). This gasoline station was removed from the area of the current I-4 westbound off-ramp in the northwest quadrant of the I-4 and Sand Lake Road interchange. As shown on **Figure 4**, a wet detention stormwater pond will be constructed adjacent to the former 7-Eleven store location.

The Oculus files contained information documenting three 10,000 gallon gasoline USTs that were installed during 1979 and removed during 1989. Universal Engineering Services installed four compliance monitoring wells during 1988. Elevated groundwater contamination was detected in the monitoring wells. PIECO removed the USTs and 522 tons of excessively contaminated soils during 1989. The excavation was reportedly “overdug” and extended past the impacted soils in both depth and width. No post-excavation groundwater documentation was available.

A 1989 FDEP letter was sent to Mr. Stafford, indicating that the roadway could be constructed providing that no dewatering was performed and that the contamination would be assessed once the facility was funded under the state cleanup program. The 7-Eleven site is in the Early Detection Incentive (EDI) program and is currently scored a 31. It is listed as inactive. Apparently no groundwater assessments have been performed.

Mr. Stafford was reportedly contacted several months ago by a firm that was assigned by FDEP to work on the former 7-Eleven site through the Low Score Site Initiative process. Mr. Stafford has indicated that he will contact the FDEP and obtain the sampling data prior to performing any Level 2 Assessment at this location.

Based on the potential for groundwater impacts at the historical 7-Eleven facility and the proposed wet detention design of Ponds 206, 206A and 206B, the historical 7-Eleven facility and pond sites should be considered a High Risk.

7.6 Other General Conclusions and Recommendations

The nature and scope of this Level 2 Assessment was not intended to provide a warranty that the project corridor is free of contamination or release contractors from complying with any and all permitting requirements and/or construction specifications that would represent a liability to the FDOT or to the User of this report.

Although contaminant source material may not be present within the proposed project corridor on some sites investigated, exceedances of surface water discharge criteria may be encountered while performing dewatering in the project corridor. Although these could be due to background conditions only, the FDOT should ensure that FDEP NPDES discharge criteria are met by the contractor during construction.

The data provided in this Level 2 Assessment should be utilized as the ROW acquisition process progresses. FDOT legal representatives should be consulted regarding the statutory and financial responsibility for ownership of contaminated property. GEC also recommends that asbestos and other hazardous building materials survey be conducted at locations in which existing structures will be acquired and demolished as part of this project.

If petroleum-containing or hazardous materials, and/or contaminated soils/groundwater are encountered during performance of construction activities, appropriate activities should be immediately taken to protect site worker safety and (if possible) to prevent the spread of contamination to otherwise non-impacted media. If such materials should be encountered, or if the proposed roadway alignment or stormwater pond sites are changed, GEC should be contacted immediately for consultation.

8.0 REPORT LIMITATIONS

The findings, opinions, conclusions, and recommendations presented herein are based on the soil and groundwater samples obtained at specific locations and explored depths below ground surface at the time of this assessment (December 2014 and February 2015). The Level 2 Assessment was conducted based in part on readily available and practically reviewable information contained in the public record. GEC does not warrant or guarantee the accuracy or completeness of this information. Some of this public record information may be dated and not representative of conditions at the time this report was prepared (December 2014 through February 2015), or in the future. Please refer to this report and supporting documentation, including the January 2014 CSER, in its entirety for a complete understanding regarding our evaluation methodology and the age and limitations of the data upon which we have relied in formulating our findings, opinions, conclusions and/or recommendations.

The conclusions and recommendations presented herein are based on the OVA screening at pre-determined locations, public record information review, and analytical laboratory analysis results. Investigation of the full extent of any contamination plumes was not the objective of this Level 2

Assessment. Groundwater samples collected during the Level 2 Assessment activities were obtained by the installation of temporary groundwater monitoring wells.

This report does not contain discussions on asbestos-containing materials surveys (other than the survey described in this report), lead-based paint surveys, mold surveys, radon gas surveys, lead in drinking water analysis, wetlands surveys, regulatory compliance audits, cultural and historical analyses, industrial hygiene or health and safety audits, ecological surveys, endangered or threatened species evaluations, indoor air quality surveys, engineering investigations, or building suitability studies.

9.0 USE OF REPORT

This report is intended for the exclusive use of our clients, HNTB and FDOT, and for specific application to our clients' project. GEC expressly disclaims any and all liability resulting from reliance on this report by those not authorized, in writing, by GEC.

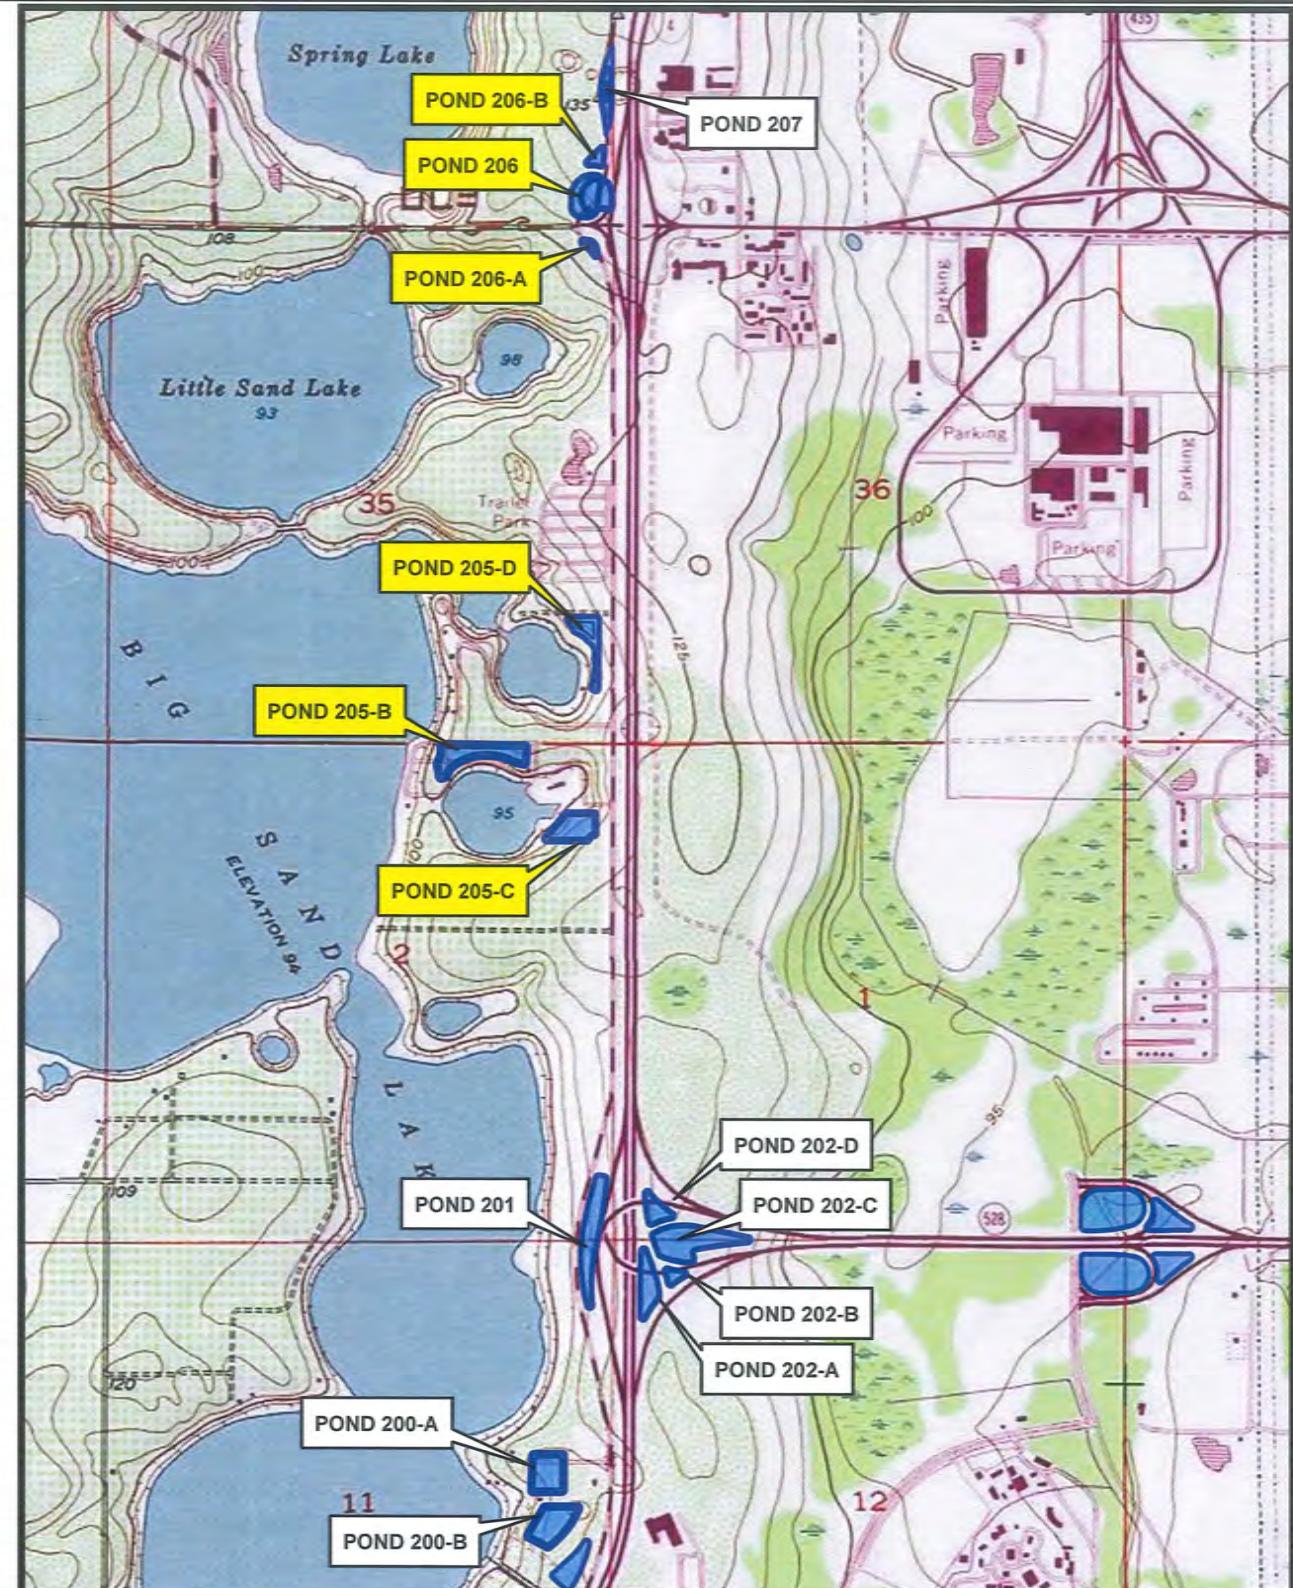

GEC has strived to provide the services described in this report in a manner consistent with that level of care and skill ordinarily exercised by members of our profession currently practicing in Central Florida. No other representation is expressed or implied in this document.

The conclusions or recommendations of this report should be disregarded if the nature, design or location of the proposed corridor and facilities is changed. If such changes are contemplated, GEC should be retained to review the new plans to assess the applicability of this report in light of proposed changes.

Lead - Total	3.47	400	1,400	*
Mercury - Total	0.0322	3	17	2.1

Notes:

1. All measurements are in mg/kg - milligrams per kilogram.
2. RSCTL - Soil Cleanup Target Level (SCTL) for residential land use.
3. ISCTL - SCTL for industrial/commercial land use.
4. LSCTL - SCTL for leachability based upon groundwater criteria.
5. FAC - Florida Administrative Code.
6. "U" - parameter not detected at the method detection limit shown.
7. TCLP - Toxic Characteristic Leachate Procedure.
8. "I" - analyte detected between the method detection limits and the practical quantitation limits.
9. "V" - Indicates that the analytes was detected in both the sample and associated method blank.
10. TPH - Total Petroleum Hydrocarbons.
11. ft bls - feet below land surface.
12. * - Leachability values may be derived using the SPLP Test to calculate site-specific SCTLs or may be determined using TCLP in the event oily wastes are present.
13. # - Must be converted into Benzo(a)pyrene Equivalents.

Table 3B
Soil Analytical Laboratory Results
I-4 PD&E STUDY
Level 2 Contamination Assessment for Pond 205C - Segment 2
FPID No. 432100-1-22-01
GEC Project No. 3492E

Sample Name	CS-15	FAC 62-777 SCTL		
Sample Interval (ft bls)	0 - 2	RSCTL	ISCTL	LSCTL
Sample Date	12/19/2014			
Arsenic - Total	0.603 I	2.1	12	*

Notes:

1. All measurements are in mg/kg - milligrams per kilogram.
2. RSCTL - Soil Cleanup Target Level (SCTL) for residential land use.
3. ISCTL - SCTL for industrial/commercial land use.
4. LSCTL - SCTL for leachability based upon groundwater criteria.
5. FAC - Florida Administrative Code.
6. "U" - parameter not detected at the method detection limit shown.
7. TCLP - Toxic Characteristic Leachate Procedure.
8. "I" - analyte detected between the method detection limits and the practical quantitation limits.
9. "V" - Indicates that the analytes was detected in both the sample and associated method blank.
10. TPH - Total Petroleum Hydrocarbons.
11. ft bls - feet below land surface.
12. * - Leachability values may be derived using the SPLP Test to calculate site-specific SCTLs or may be determined using TCLP in the event oily wastes are present.
13. # - Must be converted into Benzo(a)pyrene Equivalents.

I-4 PD&E STUDY
Level 2 Contamination Assessment for Pond 205B - Segment 2
FPID No. 432100-1-22-01
GEC Project No. 3492E

Sample Name	CS-20	FAC 62-777 SCTL		
Sample Interval (ft bls)	0 - 2	RSCTL	ISCTL	LSCTL
Sample Date	12/19/2014			
Chlordane (Tech)	0.72	---	---	---
Chlordane - alpha	0.22	---	---	---
Chlordane - gamma	0.19	---	---	---
Chlordane - Total	1.13	3	14	9.6

Notes:

1. All measurements are in mg/kg - milligrams per kilogram.
2. RSCTL - Soil Cleanup Target Level (SCTL) for residential land use.
3. ISCTL - SCTL for industrial/commercial land use.
4. LSCTL - SCTL for leachability based upon groundwater criteria.
5. FAC - Florida Administrative Code.
6. "U" - parameter not detected at the method detection limit shown.
7. TCLP - Toxic Characteristic Leachate Procedure.
8. "I" - analyte detected between the method detection limits and the practical quantitation limits.
9. "V" - Indicates that the analytes was detected in both the sample and associated method blank.
10. TPH - Total Petroleum Hydrocarbons.
11. ft bls - feet below land surface.
12. * - Leachability values may be derived using the SPLP Test to calculate site-specific SCTLs or may be determined using TCLP in the event oily wastes are present.
13. # - Must be converted into Benzo(a)pyrene Equivalents.

Groundwater Analytical Laboratory Results
I-4 PD&E STUDY
Level 2 Contamination Assessment for Pond 205C - Segment 2
FPID No. 432100-1-22-01
GEC Project No. 3492E

Sample Name	TMW-5	FAC 62-777
Sample Interval (ft bls)	1.8 - 6.8	GCTL
Sample Date	12/19/2014	
Barium - Total	7.23 I	2,000
Methylene Chloride	2.2 I	5.0

Notes:

1. All concentrations reported in µg/L (micrograms per liter).
2. FAC - Florida Administrative Code.
3. GCTL - Groundwater Cleanup Target Level.
4. ft bls - feet below land surface.
5. "I" - Analyte detected between the detection method limits and the practical quantitation limit.
6. "N" Presumptive evidence of presence of material.

RE: Laboratory Results for

Project Number: [none], Project Name/Desc: I-4 Level II

ENCO Workorder(s): A407553

Dear Richard McCormick,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Friday, December 19, 2014.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

A handwritten signature in black ink that reads "David M. Camacho".

David Camacho

ANALYTICAL RESULTS

Description: TMW-5

Lab Sample ID: A407553-02

Received: 12/19/14 15:35

Matrix: Ground Water

Sampled: 12/19/14 11:15

Work Order: A407553

Project: I-4 Level II

Sampled By:

Semivolatile Organic Compounds by GCMS

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*	Not reported due to interference.
GC-07	Confirmation result exceeds 40% RPD, lower result reported due to interference.
J-01	Result is estimated due to positive results in the associated method blank.
J-02	Result is estimated due to bias in the associated laboratory control sample (LCS).
J-04	Result estimated, calibration verification standard failed with high bias.
J-05	Result estimated, calibration verification standard failed with low bias.
O-01	This compound is a common laboratory contaminant.
QL-02	The associated laboratory control sample exhibited high bias; since the result is ND, the impact on data quality is minimal.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM-11	Precision between duplicate matrix spikes of the same sample was outside acceptance limits.
QM-13	Suspected matrix effects
QS-03	Surrogate recovery outside acceptance limits
QV-01	The associated continuing calibration verification standard exhibited high bias; since the result is ND, the impact on data quality is minimal.

APPENDIX C Laboratory Analytical Results

1.0 INTRODUCTION

On February 13, 2015, an Asbestos Hazard Emergency Response Act (AHERA)-certified asbestos inspector conducted an asbestos-containing materials (ACM) survey of debris piles discovered on proposed Pond Sites 205A and 205B located at 9200 and 9278 Turkey Lake Road, Orlando, Orange County, Florida. The area of the survey included accessible portions of three piles of debris described to contain shingles, one pile of debris described to be from a demolished residential structure, and the slab of the demolished residential structure. Aerostar SES LLC (Aerostar) is a Licensed Asbestos Business Organization, recognized by the Florida Department of Business and Professional Regulation (DBPR), Asbestos Licensing Unit, License Number ZA455. All survey activities were conducted under the direction of a DBPR-Licensed Asbestos Consultant. Copies of our certifications are included in Appendix A.

2.0 REGULATORY SUMMARY

2.1 Environmental Protection Agency

The Environmental Protection Agency (EPA) has published a list of hazardous air pollutants and promulgated the "National Emission Standards for Hazardous Air Pollutants" (NESHAP) regulations. Since asbestos presents a significant risk to human health as a result of air emissions from one or more source categories, it is therefore considered a hazardous air pollutant. The Asbestos NESHAP (40 CFR 61, Subpart M) addresses milling, manufacturing and fabricating operations, demolition and renovation activities, waste disposal issues, active and inactive waste disposal sites and asbestos conversion processes.

Friable ACM is defined by asbestos NESHAP regulations, as any material containing more than one percent (1%) asbestos as determined using the method specified in Appendix E, Subpart E, 40 CFR Part 763, Section 1, Polarized Light Microscopy (PLM), that, when dry, can be crumbled, pulverized or reduced to powder by hand pressure (Sec. 61.141).

Non-friable ACM is any material containing more than one percent (1%) asbestos as determined using the method specified in Appendix E, Subpart E, 40 CFR Part 763, Section 1, PLM, that, when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure (Sec. 61.141).

EPA also defines two categories of non-friable ACM: Category I and Category II non-friable ACM.

- Category I non-friable ACM is any asbestos-containing packing, gasket, resilient floor covering or asphalt roofing product which contains more than one percent (1%) asbestos as determined using PLM according to the method specified in Appendix E, Subpart E, 40 CFR Part 763 (Sec. 61.141).
- Category II non-friable ACM is any material, excluding Category I non-friable ACM, containing more than one percent (1%) asbestos as determined using PLM according to the methods specified in Appendix E, Subpart E, 40 CFR Part 763, that, when dry,

cannot be crumbled, pulverized, or reduced to powder by hand pressure (Sec. 61.141).

"Regulated Asbestos-Containing Material" (RACM) is: (a) friable asbestos material, (b) Category I non-friable ACM that has become friable, (c) Category I non-friable ACM that will be or has been subjected to sanding, grinding, cutting or abrading, or (d) Category II non-friable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations.

Category I non-friable ACM must be inspected and tested for friability if it is in poor condition before demolition to determine whether or not it is subject to NESHAP. If the ACM is friable, it must be handled in accordance with NESHAP. Asbestos-containing packings, gaskets, resilient floor coverings and asphalt roofing materials must be removed before demolition only if they are in poor condition and are friable.

NESHAP further requires that if a facility is demolished by intentional burning, all of the facility's ACM, including Category I and II non-friable ACM must be removed prior to burning (Sec. 61.145(c)(10)).

If Category I or Category II non-friable ACM is to be sanded, ground, cut, or abraded, the material is considered RACM and the owner or operator must abide by the following (Sec. 61.145(c)(1)):

- (i) Adequately wet the material during the sanding, grinding, cutting or abrading operations;
- (ii) Comply with the requirements of 61.145(c)(3)(i) if wetting would unavoidably damage equipment or present a safety hazard; and
- (iii) Handle asbestos material produced by the sanding, grinding, cutting, or abrading, as asbestos-containing waste material subject to the waste handling and collection provisions of Section 61.150.

Except for the following, Section 61.145(c) of the NESHAP regulations requires that each owner or operator of a demolition or renovation activity involving RACM remove all such material from a facility being demolished or renovated before any activity begins that would break up, dislodge, or similarly disturb the material or preclude access to the material for subsequent removal.

ACM need not be removed before demolition if it:

- (i) Is a Category I non-friable ACM that is not friable;
- (ii) Is on a facility component that is encased in concrete or other similarly hard material and is adequately wet whenever exposed during demolition;
- (iii) Was not accessible for testing and therefore was not discovered until after demolition began and, as a result of the demolition, cannot be safely removed. If not removed for safety reasons, the exposed RACM and any asbestos-contaminated debris must be

- treated as asbestos-containing waste material and kept adequately wet at all times until disposed of; or
- (iv) Is a Category II non-friable ACM and the probability is low that the material will become crumbled, pulverized, or reduced to powder during demolition.

2.2 Occupational Safety and Health Administration

Occupational Safety and Health Administration (OSHA) regulates asbestos exposure during all construction work including, but not limited to, the following:

- Demolition or salvage of structures where asbestos is present;
- Removal or encapsulation of materials containing asbestos;
- Construction, alteration, repair, maintenance, or renovation of structures, substrates, or portions thereof, that contain asbestos;
- Installation of products containing asbestos;
- Asbestos spill/emergency cleanup; and
- Transportation, disposal, storage, containment of and housekeeping activities involving asbestos or products containing asbestos, on the site or location at which construction activities are performed.

OSHA Standard 29 CFR 1926.1101 requires the use of engineering controls, work practices, and personal protective equipment to reduce or eliminate employee exposure to asbestos. The OSHA standard does not apply to asbestos-containing asphalt roof coatings, cements and mastics.

2.3 State of Florida

Florida Statutes 469.004 and 469.005 require licensure of asbestos consultants and contractors by the DBPR.

Florida Statute 553.79 requires that the Department of Environmental Protection be notified in writing before a local building permit is granted for any building demolition or renovation which would disturb asbestos material.

3.0 METHODS OF INVESTIGATION

Sampling protocols set forth by the EPA under 40 CFR 763.86 were followed during the inspection. The asbestos survey was performed by observing, touching, and sampling accessible suspect construction materials throughout each debris pile. The purpose of this survey was to locate and identify suspect ACMs, to quantify the material, and to separate it into unique areas for further assessment. The condition and location of representative suspect materials were reported where easily accessible and visible.

Bulk asbestos sampling procedures utilized for the collection of suspect ACMs first required the establishment of a homogeneous sampling area. A homogeneous sampling area is defined as an area of material of the same type (texture and color) which was applied during the same general time period. Each individual sampling area was then examined and representative samples of

suspect materials were collected. The U.S. EPA has published guidelines and recommendations pertaining to surveying and sampling for friable ACMs. The guidelines were followed during the survey where appropriate. U.S. EPA publications and current regulations mainly address friable materials, such as surface finishes and structural fireproofing. The samples were analyzed by PLM with dispersion staining according to EPA Method 600/R-93/116. The PLM test is an EPA-approved analytical method for asbestos identification. The test uses the unique optical properties of mineral forms in the samples to specifically identify the various asbestos types.

Where distinct layers were present, bulk samples were collected to represent each individual layer of the suspect material. Mastic and/or other adhesive substances were included when possible. At the time of sample collection, the inspector noted material type, approximate amount, sampling locations, and condition of the materials.

Samples were labeled with an alphanumeric identification system (xxx(x)-yy-z). The first set of numbers (xxx(x)) indicates which debris pile the material was collected from, starting with the western most debris pile and moving easterly to the debris pile from the demolished residential structure. The second set of numbers (yy) indicates the homogeneous area designation assigned by the asbestos inspector. The third set of numbers (z) is the individual sample identification number.

The surface area of the samples was adequately wetted prior to sample collection. No visible emissions were allowed. Samples were transported to EMSL Analytical Inc. (EMSL), 5125 Adanson Street, Suite 900, Orlando, Florida 32804. EMSL is accredited by the National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP) to conduct PLM analysis. A copy of the laboratory credentials is included in Appendix A.

4.0 RESULTS

On February 13, 2015, Mr. John Hubbard and Ms. Ashley Block, AHERA-certified Asbestos Inspectors, conducted an asbestos survey of three debris piles described as shingles debris, one debris pile from a demolished residential structure, and the concrete slab from the demolished residential structure to identify the locations, quantities, and conditions of ACMs.

4.1 Homogeneous Areas

Debris Pile #1, located in the center of the driveway loop along the eastern edge of the pond contained suspect roofing material and metal roof drip edge. Two homogeneous areas were identified and sampled from Debris Pile #1, which included:

- Brown Asphalt Shingles
- Gray Asphalt Shingles

Debris Pile #2 was dispersed near the center of the southern edge of the large hill located on the site, and contained suspect roofing materials, portions of a brick chimney, and yard waste. Two homogeneous areas were identified and sampled from Debris Pile #2, which included:

- Chimney Flashing
- Brown Asphalt Shingles

Debris Pile #3, located in the northwest portion of the large hill, contained yard waste, stepping stones, a mattress, a water heater, car parts, a tire, wood fencing, and plywood. No suspect material was identified in Debris Pile #3. No samples were collected from Debris Pile #3.

Building Debris Pile #1, located along the northern edge of the large hill, contained chain-link fencing, wood structural components, wood siding, metal drip edge, gypsum wallboard, heating, ventilation, and air conditioning (HVAC) duct, roofing material, wood paneling, household garbage, and a large tire. Four homogeneous areas were identified and sampled, which included:

- Gray Asphalt Shingles
- Felt Paper Vapor Barrier
- HVAC Duct Mastic
- Gypsum Wallboard

The concrete slab associated with the demolished residential structure, located adjacent to Building Debris Pile #1, was finished with vinyl sheet flooring (VSF). One homogeneous area was identified and sampled, which included the VSF.

Locations of the debris piles and slab are depicted on Figure 1. Photographic documentation showing the debris piles and homogeneous areas is included as Appendix B.

4.2 Sample Collection and Laboratory Analytical Results

A total of 28 samples were collected from the 9 homogeneous areas identified and submitted to EMSL for analysis by PLM. Analytical results revealed the following three homogeneous areas sampled was found to contain >1% asbestos by EPA Method 600/R-93/116:

- Chimney Flashing (homogeneous area DP2-1) located in Debris Pile #2 contained 5% Chrysotile Asbestos
- HVAC Duct Mastic (homogeneous area BDP1-3) located in Building Debris Pile #1 contained 8% Chrysotile Asbestos
- VSF – rock pattern (homogeneous area SLAB) located throughout the slab, contained 20% Chrysotile Asbestos

Asbestos sample results are summarized in Table 1. Laboratory analytical results are included in Appendix C.

5.0 LIMITATIONS

Aerostar has prepared this ACM survey for Geotechnical and Environmental Consultants, Inc., hereafter referred to as the Client. No ACM survey can eliminate all uncertainty. Professional judgment and interpretation are inherent in the process and uncertainty is inevitable. Even when sampling is executed with an appropriate site-specific standard of care, certain conditions present especially difficult detection problems. Such conditions may include, but are not limited to, physical limitations imposed by the location and accessibility of possible ACMs and the limitations of assessment technologies. Only reasonably accessible areas were surveyed as part of this investigation. Aerostar is not responsible for possible ACMs that were inaccessible and/or not located, or any consequential damages as a result thereof.

Measurements and sampling data only represent the site conditions at the time of the data collection. Aerostar makes no legal representations whatsoever concerning any matter including, but not limited to, ownership of any property or the interpretation of any law. Aerostar further disclaims any obligations to update the report for events taking place after the time during which the assessment was conducted.

This report is not a comprehensive site characterization and should not be construed as such. The opinions presented in this report are based upon the findings derived from the samples collected.

The scope of work performed herein was limited to asbestos sample collection and laboratory analysis of only the samples collected at the time of inspection. Aerostar has endeavored to meet what it believes is the applicable standard of care, and, in doing so, is obliged to advise the Client of the limitations. Aerostar believes that providing information about limitations is essential to help the Client identify and thereby manage its risks. Through additional testing, these risks can be mitigated - but they cannot be eliminated. Aerostar will, upon request, advise the Client of the additional research opportunities available, their impact, and their cost.

As noted above, the ACM survey conducted at the referenced site and this report was prepared for the use solely by the Client. This report shall not be relied upon by or transferred to any other party without the express written authorization of Aerostar; however, this report may be made available to perspective bidders for information purposes.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Aerostar has completed an ACM survey of debris piles discovered on proposed Pond Sites 205A and 205B located at 9200 and 9278 Turkey Lake Road, Orlando, Orange County, Florida. Nine homogeneous areas were identified and sampled. Analytical results of the samples revealed that three homogeneous areas contained greater than 1% asbestos by PLM. The homogeneous areas containing greater than 1% asbestos included chimney flashing, HVAC duct mastic, and VSF.

Chimney flashing, HVAC duct mastic, and VSF are NESHAP Category I non-friable ACMs. NESHAP Category I non-friable ACMs are not required to be removed prior to demolition or renovation of a building, provided that wet-demolition practices are implemented and resulting

debris from the building is properly transported to a landfill permitted for disposal of ACM. If NESHAP Category I non-friable ACMs are in poor condition or become friable during demolition, the material must be treated as a RACM and be removed by a licensed asbestos abatement contractor and disposed of at a class one landfill prior to renovation, remodeling, or demolition of the building.

Due to the presence of asbestos, OSHA's Asbestos Standard for the Construction Industry (29 CFR 1926.1101) must be followed. In accordance with the OSHA Asbestos Standard for the Construction Industry (29 CFR 1926.1101), the removal and disposal of Category I Non-friable ACMs is a Class II work activity if the material is removed in an intact condition.

Transportation of ACM should be conducted in accordance with the United States Department of Transportation (USDOT) regulations outlined in 49 CFR 173.216. ACM must be disposed at a facility permitted by the EPA to accept asbestos.

Suspect ACMs encountered during land clearing, renovation, or demolition activities that are not identified in this survey should be assumed to contain asbestos or be sampled by an AHERA-certified inspector and analyzed by an accredited laboratory.

Mayhew Environmental Training Associates
I N C O R P O R A T E D

Certificate # ME6982D62C55D04E1

John H Hubbard

*has on 7/28/2014 in Jacksonville, FL
completed the requirements for asbestos accreditation under Section 206 of TSCA Title II, 15 USC 2646*

4-hr. Asbestos Building Inspector Refresher

*as approved by FL
and the US EPA under 40 CFR 763 (AHERA)
from 7/28/2014 to 7/28/2014 and passed the associated exam on 7/28/2014
with a score of at least 70%*

UJ 2014

National Institute of Standards and Technology

Certificate of Accreditation to ISO/IEC 17025:2005

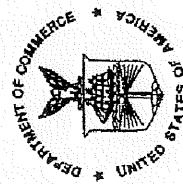

NVLAP LAB CODE: 101151-0

EMSL Analytical, Inc.
Orlando, FL

is accredited by the National Voluntary Laboratory Accreditation Program for specific services,
listed on the Scope of Accreditation, for:

BULK ASBESTOS FIBER ANALYSIS

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2005.
This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality
management system (refer to joint ISO/ILAC-IAF Communique dated January 2009).

2014-07-01 through 2015-06-30

Effective dates

For the National Institute of Standards and Technology

APPENDIX B – PHOTOGRAPHIC DOCUMENTATION

1. Looking west at Debris Pile #1 located in the center of the driveway loop on the eastern edge of the pond.

2. View of metal drip edge and shingles located in Debris Pile #1.

3. View of homogeneous area DP1-1, gray asphalt shingles, located in Debris Pile #1. No asbestos was detected in homogeneous area DP1-1.

4. View of homogeneous area DP1-2, brown asphalt shingles, located in Debris Pile #1. No asbestos was detected in homogeneous area DP1-2.

5. Looking north at the southern edge of the hill at Debris Pile #2 located near the center of the southern edge of the hill. Debris was scattered and partially buried into the side of the hill.

6. View of homogeneous area DP2-1, chimney flashing, located in Debris Pile #2. Laboratory analytical results showed 5% chrysotile asbestos in homogeneous area DP2-1.

7. View of homogeneous area DP2-2, brown asphalt shingles, located in Debris Pile #2. No asbestos was detected in homogeneous area DP2-2.

8. Additional view of homogeneous area DP2-2, brown asphalt shingles, located in Debris Pile #2. No asbestos was detected in homogeneous area DP2-2.

9. View of fencing, stepping stones, and yard waste in Debris Pile #3 located on the northwestern edge of the hill. No suspect asbestos-containing materials (ACMs) were observed in Debris Pile #3.

10. View of yard waste and a mattress located in Debris Pile #3. No suspect ACMs were observed in Debris Pile #3.

11. View of yard waste, automobile parts, plywood, and a water heater located in Debris Pile #3. No suspect ACMs were observed in Debris Pile #3.

12. View of yard waste, plywood, and a tire located in Debris Pile #3. No suspect ACMs were observed in Debris Pile #3.

13. Looking south at the Building Debris Pile #1 located on the northern edge of the hill. Note the debris pile was partially covered with vegetation.

14. Looking south at the Building Debris Pile #1 located on the northern edge of the hill. The view is of the portion of the pile with no vegetation.

15. Looking north at the Building Debris Pile #1 from the hill.

16. View of homogeneous area BDP1-1, gray asphalt shingles, located beneath the vegetation in Building Debris Pile #1. No asbestos was detected in homogeneous area BDP1-1.

17. View of homogeneous area BDP1-2, felt paper vapor barrier, located in Building Debris Pile #1. No asbestos was detected in homogeneous area BDP1-2.

18. View of homogeneous area BDP1-3, heating, ventilation, and air conditioning (HVAC) duct mastic located in Building Debris Pile #1. Laboratory analytical results showed 8% chrysotile asbestos in homogeneous area BDP1-3.

19. View of homogeneous area BDP1-4, gypsum wall board, located in Building Debris Pile #1. No asbestos was detected in homogeneous area BDP1-4.

20. Looking south at the slab located east of Building Debris Pile #1.

21. Looking northeast at the slab.

22. View of homogeneous area SLAB, vinyl sheet flooring (VSF) with rock pattern located on the slab. Analytical results showed 20% chrysotile asbestos in homogeneous area SLAB.

DP2-2-1 341501398-0009	Debris Pile 2 - Brown Asphalt Shingles	Various Fibrous Homogeneous	8% Glass	92% Non-fibrous (other)	None Detected

EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Samples received in good condition unless otherwise noted. Estimated accuracy, precision and uncertainty data available upon request. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Reporting limit is 1%
