#### 1.0 INTRODUCTION

The Florida Department of Transportation (FDOT) is proposing to reconstruct and widen I-4 as part of the I-4 Ultimate concept. This involves the build-out of I-4 to its ultimate condition through Central Florida, including segments in Polk, Osceola, Orange, Seminole and Volusia Counties. The concept design proposes the addition of two new express lanes in each direction within the center median of I-4, resulting in the reconstruction of the existing six-lane divided urban interstate to a ten-lane divided highway. The roadway improvements also include reconstruction of 19 local service interchanges and three systems interchanges.

The SR 400 (I-4) Project Development and Environment (PD&E) Study is a reevaluation project which addresses the revision from the original design concept showing two High Occupancy Vehicle (HOV) lanes, as recommended in the Environmental Impact Statement (EIS) for I-4 from SR 528 to SR 472, to the current proposed design concept of four Express Lanes. The Express Lanes are tolled lanes and will extend the full length of the project. The proposed typical section will include three general use lanes, two express lanes, an auxiliary lane (in some areas) and shoulders in each direction, with provision for a 44' rail corridor in the center median from US 27 to SR 528. The express lanes and general use lanes will be separated by two 10- or 12- foot shoulders with a barrier wall in between the shoulders.

The overall SR 400 (I-4) PD&E project limits include a total of approximately 41 miles of roadway improvements divided into two sections east and west of the I-4 Ultimate project. The approximate limits of improvement for the west section are from US 27 in Polk County to west of SR 435 (Kirkman Road) in Orange County and for the east section, from east of SR 434 in Seminole County to east of SR 472 in Volusia County. For purposes of documentation of the SR 400 (I-4) PD&E study, the east and west sections are further subdivided into segments as shown in Table 1.

Table 1: SR 400 (I-4) PD&E Segment Limits

SR 400 (I-4) I	SR 400 (I-4) PD&E West Section					
Segment 1   CR 532 (Osceola/Polk County Line) to W. of SR 528 (Beachline Expressway) in						
Segment 1	Osceola and Orange Counties (13.5 miles)					
W. of SR 528 (Beachline Expressway) to W. of SR 435 (Kirkman Road) in Oran						
Segment 2	County (3.6 miles)					
Segment 5	US 27 to CR 532 ( Osceola/Polk County Line) in Polk County (3.2 miles)					
SR 400 (I-4) I	PD&E East Section					
Segment 3	E. of SR 434 to E. of US 17/92 in Seminole County (10.2 miles)					
Segment 4	E. of US 17/92 to E. of SR 472 in Volusia County (10.1 miles)					

The majority of the proposed improvements (37.4 miles) are within District 5 and a small segment (3.2 miles) is within District 1. The entire corridor is part of the state's Strategic Intermodal System (SIS).

As part of the SR 400 (I-4) PD&E Study, HNTB has prepared this Pavement Type Selection Report for I-4, Segment 3 (East of SR 434 to East of US 17/92) in Seminole County; a project location map is provided in Figure 1. The purpose of this report is to analyze, compare and select the most feasible pavement type for this project, utilizing the methods of the 1993 American Association of State Highway and Transportation Officials (AASHTO) Guide for Design of Pavement Structures, adopted by FDOT and described in detail in the FDOT Pavement Type Selection Manual (October, 2013).

#### 2.0 PRINCIPAL FACTORS

#### 2.1 Traffic

Pavement design for new alignment and reconstruction projects requires a structural loading forecast of the 18-KIP Equivalent Single Axle Load (ESAL). The accumulated 18-KIP ESALs are used to determine the Structural Number Required (SN<sub>R</sub>) for flexible pavement and the Depth Required (D) for rigid pavement. While the total traffic volume is the main factor in determining roadway geometrics, the percent of commercial traffic and heavy load applications are the major influences in the structural pavement design. The I-4, Segment 3 corridor within the project area is expected to be utilized by local traffic and through traffic. To determine the ESALs for this project, traffic data was obtained from the I-4 SAMR Update: Design Traffic Technical Memorandum (January, 2013). Based on this memo, truck traffic percentages for the Segment 3 corridor range from 6.40 to 12.60 for year 2011. The truck factors for 2011 were reviewed for consistency by evaluating historical data provided by the FDOT Florida Traffic Online database. Based on these considerations, this project utilizes anticipated 24-hour truck traffic of 12.60% and a 20-year design. The future traffic volume projections used in the analysis are summarized in Table 2.

**Table 2: Future Traffic Projections** 

	Year	AADT
Opening Year	2020	110,400
Mid-Design Year	2030	128,800
Design Year	2040	147,200

The 18-KIP ESAL for the roadway is 28,344,000 for flexible pavement and 39,992,000 for rigid pavement. Based on this information, either asphaltic concrete (AC) or Portland cement concrete (PCC) pavement would be sufficient. Traffic information and ESAL calculations are provided in Appendix A.

**Figure 1: Project Location Map** 

#### 2.2 **Soil Characteristics**

Geotechnical data in the study area was available from the I-4 (SR 400) Interchange at SR 46 widening and rehabilitation project, FPID: 407573-1-32-01. This project is located within the I-4, Segment 3 project and included pavement design data and calculations for the I-4/SR 400 mainline. Soil samples were obtained from 18 locations along the I-4 alignment in the vicinity of the SR 46 interchange. Limerock Bearing Ratio (LBR) tests were performed on the samples using the FDOT 90 percent method. The analysis yielded a recommended design LBR of 32 for the project, which corresponds to a roadway embankment resilient modulus ( $M_R$ ) of 10,500 psi. This  $M_R$  value was used in preparing the PTSR for the I-4, Segment 3 project. The LBR report prepared for the S.R. 400 (I-4), FPID: 407573-1-32-01 project is included in Appendix B.

#### 2.3 Weather

High rainfall intensities are experienced in Florida during portions of the year. These rainfall conditions are expected to equally affect subsoil conditions for both flexible and rigid pavements; thus, the weather does not favor the placement of one type of pavement over the other. Additionally, cross slopes are designed to drain water off the pavement, and drainable base and edge drains were considered in the economic analysis to ensure the runoff would not negatively impact the concrete pavement. Therefore, either AC or PCC pavement type could be constructed with satisfactory wet weather performance and durability.

#### 2.4 Construction Considerations

The interstate will be completely reconstructed. Staged construction will be necessary for either rigid or flexible type of pavement. The available right-of-way will allow for either type to be constructed satisfactorily.

#### 2.5 **Recycling**

The existing roadway pavement is to be completely reconstructed; therefore, there is an opportunity to recycle the existing asphalt pavement in the initial construction. FDOT has successfully recycled rigid and flexible pavement, therefore, there are future recycling opportunities for both pavement types during rehabilitation of the pavements.

#### 3.0 ECONOMIC ANALYSIS

The present worth method will be used to evaluate the cost of flexible pavement versus rigid pavement. All capital outlays for each alternative, including rehabilitation costs, are converted into today's dollars to compare the alternatives.

#### 3.1 **Basis of Comparison**

The analysis will be based on the following assumptions:

Analysis Period: 40 years

Initial Pavement Design Life: 20 years

Discount Rate: 3.5%

The following baseline rehabilitation strategies were considered, as recommended in the *Pavement Type Selection Manual (October 2013)* for concrete pavement and from supporting data for lifecycles of asphalt pavement in Seminole County:

#### Concrete Pavement – Limited Access (Mainline & Shoulder)

23 Year - Concrete Pavement Rehabilitation (3% Slab Replacement)\*

33 Year - Concrete Pavement Rehabilitation (5% Slab Replacement)\*

\*Estimate is based on the percentage of slab area in the truck lane

#### <u>Asphalt Pavement - Limited Access (Mainline & Shoulder)</u>

16 Year – Mill 3 inches

4" Structural Asphaltic Concrete

32 Year - Mill 3 inches

4" Structural Asphaltic Concrete

#### 3.2 **Pavement Data**

The initial pavement designs developed for this analysis for both rigid and flexible pavement were based on the following geometry:

# of Lanes=10 (3 GUL+2 SUL in each direction)

Lane Width=12 feet

GUL: Inside Shoulder Width=12 feet, Outside Shoulder Width=12 feet SUL: Inside Shoulder Width=6 feet, Outside Shoulder Width=10 feet

Note: GUL = general use lane, SUL = special use lane

The typical section used for this analysis is provided in Appendix C and the pavement design calculations are provided in Appendix D.

**Rigid Pavement** - This pavement design has been prepared in accordance with the most recent Rigid Pavement Design Manual (RPDM) (FDOT Document No. 625-010-006-e, January, 2009). This

project is located in Seminole County. Using the Mechanistic-Empirical Pavement Design Guide (MEPDG) Design Tables, the slab thickness should be 12.5".

#### Rigid Pavement Design Parameters

18-KIP ESAL=39,992,000 Modulus of Subgrade Reaction ( $K_G$ )=200 pci Reliability (%R)=90%

 $SN_R$ =2.98 2" Type SP Structural Course (Traffic B) Optional Base Group 5 (7" LBR 100) 12" Type B Stabilization  $SN_C$ =3.10

#### 3.3 **Cost Data for Economic Analysis**

The unit prices used for this economic analysis are weighted averages obtained from FDOT's statewide item average unit costs from 12/01/2012 to 11/30/2013 and from D5 estimates, where available. The unit costs used are provided in Appendix E and are summarized in Table 3.

**Table 3: Pavement Unit Prices** 

Item	Price	Unit
Type B Stabilized (LBR 40)	\$3.25	Sq. Yd
OBG-1, Type B-12.5	\$9.14	Sq. Yd
OBG-5	\$9.54	Sq. Yd
OBG-11	\$12.71	Sq. Yd
Milling 1" Avg. Depth	\$2.08	Sq. Yd
Milling 3" Avg. Depth	\$2.00	Sq. Yd
Type SP Traffic Level B	\$85.00	Ton
Type SP Traffic Level D	\$85.00	Ton
Type SP Traffic Level D PG76-22	\$92.00	Ton
JPCP	\$55.00	Sq. Yd
CPR - Slab Replacement (3%)	\$400.00	Cu. Yd
CPR - Slab Replacement (5%)	\$400.00	Cu. Yd
Edgedrain (Draincrete)	\$26.72	Ft
Edgedrain Outlet Pipe (4 in)	\$30.68	Ft
Source: FDOT, 12 month moving statewide average	ages and FDOT - D5 estim	ates.

#### 3.4 **Cost Comparison**

A life cycle economic analysis per mile of concrete pavement and asphalt pavement was performed using an analysis period of 40 years and a discount rate of 3.5%. Based on the life cycle cost analysis, the total present worth costs for concrete pavement is \$6,803,632 and for flexible pavement, \$5,425,646. The results of the analysis are summarized in Table 4. The details of the analysis are included in Appendix E.

#### 4.0 SECONDARY FACTORS

#### 4.1 Performance of similar pavements in the area

The existing pavement sections, west and east of the I-4 Segment 3 section are both constructed with AC pavement. In general, these sections have not experienced any areas of premature distress and maintenance resurfacing is not excessively disruptive. The average age to rehabilitation for flexible pavements in Seminole County was reviewed. The average age to

rehabilitation over the last 8 years in Seminole County ranged from 12.8 years to 22.1 years. The average age to rehabilitation for FC-2 flexible pavements in Orange County was also reviewed. The average age to rehabilitation over the 7-year period ending in 2011 in Orange County ranged from 12 years to 16.9 years. With improvements made to FC-5 over the years, it is expected that an FC-5 flexible pavement will outperform previous FC-2 sections.

**Table 4: Pavement Type Selection Economic Analysis** 

Con	Concrete Pavement (PCC)								
			Cost		<u>P / F</u>		PRESENT WORTH		
	Initial	2020	\$6,274,943	*	1.00000	=	\$6,274,943

32	Year	2052	\$2,027,373	*	0.33259	=	\$674,284		
					TOTAL AGENCY COSTS	=	\$5,681,675		
					USER COSTS		N. / A		
					O3LK CO313	=	N/A		
					SALVAGE VALUE	=	\$256,029		

Performance of concrete pavement in Central Florida was also reviewed. In the Orlando area within Orange County, concrete pavement was originally constructed on I-4 through the downtown area. This concrete pavement section has been in service for approximately 50 years and has undergone two major rehabilitations. Other concrete pavement sections in the Central Florida region were reviewed, including the average age to rehabilitation for concrete pavement in Hillsborough County. This data showed that over a 3 year period between 2006 and 2008, the average age for the rehabilitation cycle for these pavements within Hillsborough County were 20 years, 25 years and 22 years. Pavement performance and rehabilitation data is provided in Appendix F.

#### 4.2 Adjacent Existing Pavements

The existing roadway sections, adjacent to the I-4 Segment 3 section are both constructed with flexible pavements. In addition, recent widening and rehabilitation projects throughout the corridor have been constructed with flexible pavement. The I-4, Segment 4 section, immediately east of Segment 3, is currently being evaluated for pavement type selection as part of the SR 400 (I-4) PD&E study.

#### 4.3 Conservation of Materials and Energy

There are no significant differences in the energy consumption used to produce, transport or construct either type of pavement.

#### 4.4 Availability of Local Materials or Contractor Capabilities

Materials are available locally for both pavement types. However, the majority of contractors in the Central Florida region are more familiar with asphalt pavement, since it is more commonly used in roadway projects in the area. FDOT District 5 also has prequalified contractors that have experience placing concrete pavement on major projects. Neither of the pavement types uses materials that are particularly scarce in Central Florida.

#### 4.5 **Traffic Safety**

Current FDOT design guidelines and specifications for both the AC pavement and PCC pavement alternatives provide similar characteristics for wearing course, delineation through pavement and shoulder contrast, reflectivity under highway lighting and the maintenance of a nonskid surface.

#### 4.6 Incorporation of Experimental Features

There are no experimental features included in this pavement type selection report.

#### 4.7 **Stimulation of Competition**

Stimulation of competition is encouraged to avoid monopoly situations and improve products and methods in the projection of paving products. However, neither pavement type currently indicates a distinct advantage to provide more stimulation of competition over the other.

# 4.8 Municipal Preference, Participating Local Government Preference, and Recognition of Local Industry

No preferences apparent for pavement type by FDOT, which will be maintaining and operating this roadway facility.

#### 5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the preceding life cycle cost analysis and considering all other design factors evaluated in this report, AC pavement has a long term owner's cost advantage of 20%. Therefore, it is recommended that asphalt pavement be considered as the pavement type for the SR 400 (I-4) Segment 3 corridor.

## **APPENDIX B**

**GEOTECHNICAL INFORMATION** 

December 5, 2005

URS Corporation 315 East Robinson Street, Suite 245 Orlando, Florida 32801

Attention:

Mrs. Yassi Myers, P.E.

Subject:

Design Limerock Bearing Ratio Evaluation

I-4 / SR 46 INTERCHANGE

FIN No. 407573

Seminole County, Florida GEC Project No. 2174G

Dear Mrs. Myers:

Geotechnical and Environmental Consultants, Inc. (GEC) has performed 18 Limerock Bearing Ratio (LBR) tests on representative soils encountered along the alignments of interest of the I-4/S.R. 46 Interchange project in Orlando, Florida. Thirteen of the LBR samples were taken from Stratum No. 1 (A-3) and five samples from Stratum No. 2 (A-2-4), which were the predominant shallow soil types encountered in our borings. One LBR value was unusually low, another was unusually high; therefore, they were not considered in the analyses (see attached for more details).

Our design LBR analysis included both the FDOT Mean Method and the 90 Percent Method. The FDOT Mean Method resulted in a design LBR of 33 and the 90 Percent Method resulted in a design LBR of 32. We recommend a design LBR of 32 for this project. The results of our analyses are attached.

GEC trusts the information submitted in this letter will meet your current needs. If you have any questions, or if we may be of further assistance, please call.

Rachel F. P. 16/05

Rachel F. Andre, P.E.

Florida Registration No. 62418

Project Engineer

Very truly yours,

GEOTECHNICAL AND ENVIRONMENTAL CONSULTANTS, INC.

## **APPENDIX D**

PAVEMENT DESIGN CALCULATIONS

### Pavement Design For New Pavement (Flexible)

Project: SR 400 (I-4) Mainline

Opening + 20 years =

**Given:**  $ESAL_D = 28,344,000$ 

Traffic Level D

 $M_R = 10,500 \text{ psi}$ 

Assume a 90% reliability

1.0 From table 5.3, the Structural Number Required  $(SN_R)$  =

5.15

2.0

$SN_R$	=		$SN_C$									
5.15	=	$a_1$	$D_1$	+	$a_2$	$D_2$	+	$a_3$	$D_3$	+	$a_4$	$D_4$
5.15	=	0	0.75	+	$a_2$	$D_2$	+	$a_3$	$D_3$	+	0.08	12
5.15	=		0.00	+	$a_2$	$D_2$	+	$a_3$	$D_3$	+		0.96
4.19	=				$a_2$	$D_2$	+	$a_3$	$D_3$			

3.0 With the following eqn. find the base group from table 5.9

 $4.19 = a_2 D_2 + a_3 D_3$ 

Base group

11

yields a 5.00

inch structural course with an SN of

4.27

Note: the structural number found in table 5.9 must be slightly larger than the  $a_2D_2$  +  $a_3D_3$  ratio

4.0

Calculate the Structural number (  $\mathrm{SN}_{\mathrm{C}}$ ), so that it is equal to or larger than  $\mathrm{SN}_{\mathrm{R}}$ .

Material	Thickness	Coefficient	$SN_C$	
Structural Course	5.00	0.44	2.20	see table 5.4
Base (OBG 11 - 12" Limerock - LBR 100)	12.00	0.18	2.16	see table 5.6
Stabilization (LBR 40)	12.00	0.08	0.96	
Total thickness	29.00 inches	SN <sub>C</sub> =	5.32	<u> </u>

 $SN_C \ge SN_R$ 5.32  $\ge$  5.15

### New Pavement Design (Modulus of Subgrade Reaction = 200) (Rigid)

REQUIRED DEPTH (D<sub>R</sub>) FOR 90% RELIABILITY

From table 3.2

ESAL's Depth Region: 2 Table E.3

Table E-7 from the 2009 FDOT Rigid Pavement Design Manual Based on MEPDG with Tied Concrete Shoulders
When designing with MEPDG tables, Mainline Slab thickness must
be increased by 1/2" and a 14' slab used

40,000,000

### Pavement Design For New Pavement (Flexible)

Project: SR 400 (I-4) Mainline Shoulder

Opening Year 2020

Design Year 2040

Given:  $ESAL_D = 850,320$ 

 $M_R = 10,500 \text{ psi}$ 

Assume a 90% reliability

From table 5.3 (or A.4a), the Structural Number Required ( $SN_R$ ) = 1.0

2.98

 $D_3$ 

 $D_3$ 

2.05

 $a_3$ 

 $D_4$ 

 $a_4$ 

0.08 12

 $D_2$ 

 $D_2$ 

 $\mathsf{SN}_\mathsf{R}$  $\mathsf{SN}_\mathsf{C}$ 2.0

> D₁ 2.98  $a_1$ 2.98 0

2.98 = 0.00  $a_2$  $D_2$  $a_3$  $D_3$ 0.96

 $a_2$ 

 $a_2$ 

В

2.02  $D_2$  $D_3$  $a_2$ 

3.0 With the following eqn. find the base group from table 5.9

> 2.02  $D_2$  $D_3$  $a_2$  $a_3$

Traffic Level

0.75

yields a 2.00 inch structural course with an SN of Base group

Note: the structural number found in table 5.9 must be slightly larger than the  $a_2D_2 + a_3D_3$  ratio

Calculate the Structural number (  $SN_C$  ), so that it is equal to or larger than  $SN_R$ . 4.0

Material	Thickness	Coefficient	SN <sub>C</sub>	1
Structural Course (Traffic Level B)	2.00	0.44	0.88	see table 5.4
Base (OBG 5- LBR 100)	7.00	0.18	1.26	see table 5.6
Stabilization (LBR 40)	12.00	0.08	0.96	
		SN <sub>C</sub> =	3.10	=

 $\mathsf{SN}_\mathsf{C}$ > 3.10 2.98 >

## **APPENDIX F**

PAVEMENT PERFORMANCE DATA

# Rehabilitation Age by Year For Seminole County

27FEB2014

Other Conditions: Pavement= Asphalt

Year Rehabilitated	Lane Miles Rehabilitated	Average Rehabilitation Age	Standard Deviation
2006	17.1	20.0	5.3
2007	29.5	12.8	3.2
2008	42.3	20.1	9.2
2009	15.1	13.9	6.6
2010	43.6	16.0	1.9
2011	33.2	22.1	11.3
2012	6.5	15.0	0.0
2013	39.9	14.7	5.3

13JUN2012

### Deficient Rehabilitation age by Year

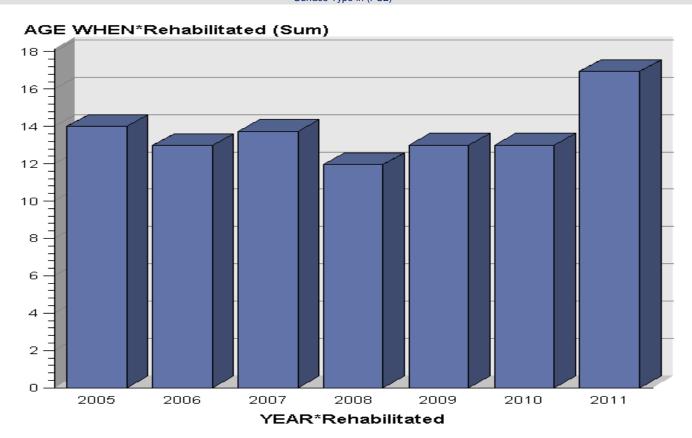

For Orange County

Other Conditions: Pavement= Asphalt Surface Type in (FC2)

Year Rehabilitated	Lane Miles Rehabilitated	Average Rehabilitation Age	Standard Deviation
2005	5.0	14.0	0.0
2006	7.5	13.0	1.1
2007	62.6	13.7	2.6
2008	36.4	12.0	0.2
2009	35.6	13.0	0.0
2010	11.3	13.0	0.0
2011	27.8	16.9	3.1

## Deficient Rehabilitation age by Year For Orange County

Other Conditions: Pavement= Asphalt Surface Type in (FC2)

13JUN2012

## Deficient Rehabilitation age by Year

### For Hillsborough County

Other Conditions: Pavement= Concrete

Surface Type in (CONC)

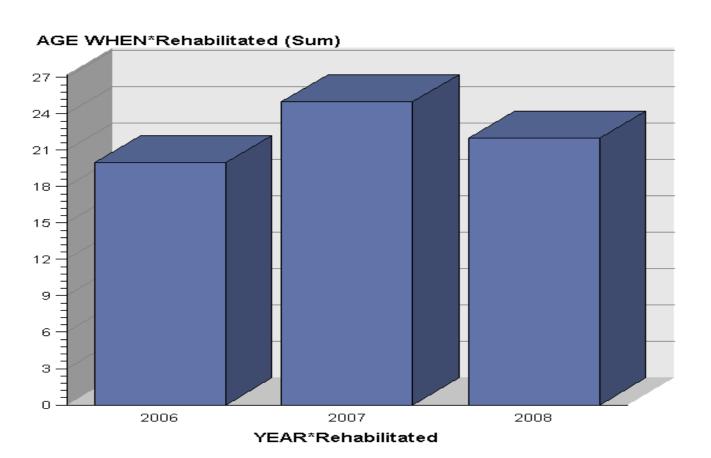

Year Rehabilitated	Lane Miles Rehabilitated	Average Rehabilitation Age	Standard Deviation
2006	10.8	20	0
2007	26.7	25	0
2008	9.3	22	0

# Deficient Rehabilitation age by Year

For Hillsborough County

Other Conditions: Pavement= Concrete

Surface Type in (CONC)
